## Interact Fire Solutions Fit For Inverness

**Interact Fire Solutions has been awarded the contract to supply its intumescent column castings to a new health and fitness centre in Inverness.** Interact Fire Solutions will supply column casings providing 120 minutes fire protection to the four structural steel columns, while meeting the demands of high decoration along with a very low life maintenance requirement.

Interact Fire Solutions manufactures fire protective castings for structural steels columns, which offer up to two hours fire protection. Cast from epoxy intumescent, protective casings can be made for any shape column or feature. At the Inverness leisure centre, the columns are 324mm in diameter and 10m tall.

One of the requirements of the project at Inverness is that the columns have a highly decorative finish, while being semi-exposed thus necessitating a weather resistant coating which does not depend on the decorative coating to protect the intumescent from damage. Interact's cast epoxy casings provide a perfect base for a very high decorative finish, which is robust and long lasting and fully weather resistant.

This contract is Interact's second in Inverness, the first being a project for Scottish Natural Heritage.

For further information on fire protection from Interact Fire Solutions, visit [www.interactfire.co.uk](http://www.interactfire.co.uk) or call 01694 751394.
